One day-long spin lasts for 59 Earth days. But because of its fast orbit, one Mercury year takes 88 Earth days. This means that two years on Mercury lasts for only three Mercurian days. The planet's sunrise ...

Mercury takes 88 Earth days to go around the Sun. In 59 Earth days, it makes one complete turn on its axis, with respect to very distant stars (in other words, it takes 59 days for any one star to return to ...

It takes Mercury 59 Earth days to complete one rotation on its axis, but it only takes 88 Earth days to complete one orbit around the Sun. This means that one day on Mercury (one ...

One day on Mercury seems to last two Mercurian years (or 176 Earth days), i.e., sunrise to sunrise. It is daytime for one Mercurian year, and nighttime for one Mercurian year.

How long is a day on Mercury? A solar day - the amount of time it takes the Sun to rise, set, and rise to the same place again - on Mercury lasts about 176 Earth days.

Mercury has a very long day compared to Earth. One day on Mercury (the time it takes to complete one rotation on its axis) is approximately 58.6 Earth days. Additionally, the planet ...

Named after the Roman messenger of the gods, who was known for being very ...

Credit: NASA/JPL/USGS This small planet spins around slowly compared to Earth, so one day lasts a long time. It takes 59 Earth days to make one day (or one full rotation) on Mercury. ...

Named after the Roman messenger of the gods, who was known for being very swift, Mercury takes only 88 days to complete one orbit around the Sun - the shortest year of all planets.

Orbit around the Sun: Because Mercury is so close to the Sun, it has the smallest orbit of all the planets. Mercury's year (the time it takes to orbit the Sun one time) is 88 Earth days long.

How long does mercury run

To break it down, Mercury takes roughly 88 Earth days to complete a single orbit around the Sun. Between this rapid orbital period and its slow rotational period, a single year on Mercury is...
