---

Device-to-device (D2D) communication commonly refers to a type of technology that enable devices to communicate directly with each other without communication infrastructures such ...

Our Private 5G book is informed by our experience designing and implementing an open source Kubernetes-based edge cloud that hosts -- ...

The document discusses scenarios for 5G communication without a base station, highlighting Device-to-Device Communication (D2D), Relay Mode, ...

It builds a self-organization and self-healing communication network via connection of multi LoRa devices. Then, users can communicate and text to each other with no need of cell phone, base ...

The article provides a consolidated synthesis of the deployment of 5G services using UAVs and delves into the mmWave potential for radio communication. It also addresses UAV-based ...

I had previously written about how 5G connections are established over here, hence I will be diving directly into the SNI5GECT framework. In this diary, I will briefly provide an overview of the ...

D2D communication allows nearby devices to communicate directly, without going through the BS or core network. This direct link reduces transmission delay, improves SE, and saves energy, ...

But are you able to communicate beyond earshot without cell or internet connectivity? How vital are voice and data ...

Its non-cellular network approach allows customers to create private networks without needing access to base stations or service provider infrastructure. It is suitable for large-scale ...
