-----

In this context, solar evaporation has recently emerged as a promising approach to enhance lithium extraction, attracting growing research interest. This review first examines the ...

The research team involved in the new study seems to have overcome some of the limitations associated with prior seawater lithium extraction with the use of their newly developed ...

Inspired by nature's ability to selectively extract species in transpiration, we report a solar transpiration powered lithium extraction and storage (STLES) device that can extract and store - lithium from ...

Inspired by the mangroves, authors developed a direct lithium extraction method from Salt Lake brines through the synergistic effect of an ion separation membrane and a solar evaporator.

Solar-driven direct lithium extraction (SDLE) systems combining conventional evaporation and DLE techniques can overcome the present challenges of Li extraction, promising to advance the ...

Solar-enhanced lithium extraction (SEIE) technology utilizes green sources of energy to achieve a high water evaporation rate, serving as a driving force for the efficient capture and ...

The team has tested a small prototype over five cycles of lithium adsorption and release, and the harvested water met the drinking standards of the World Health Organization.

To achieve environmentally and efficient lithium separation, selective extraction driven by interfacial photothermal evaporation is implemented in this study. Herein, we design a 3D solar ...

Herein, an efficient proof-of-concept integrated solar microevaporator system is developed to realize synergistic solar-enhanced lithium recovery and water footprint management from hypersaline salt ...
