What functionalities can be found in a battery management system (BMU)?

Some other functionalities that can be in the BMU are interlock functionality or the real time clock and vector management system for the software. BMS Software Architecture: The battery management system architecture has different layers that abstract different parts of hardware.

What is the generalized architecture of proposed battery management system (BMS)?

The generalized architecture of Proposed BMS design is shown in Fig. 9 (a)- (b). In proposed design, battery management systems (BMS) employ LTC6812 analogue front end (AFE) IC to monitor and regulate battery cell conditions. AFE has cell voltage sensor and external balancing circuitry MOSFET driving connections.

What is a battery management system (BMS)?

The BMS enforces safe operating limits. It prevents overcharge, deep discharge, overcurrent, and overheating. In extreme cases, it can disconnect the battery entirely via MOSFETs or contactors. Multiple protection layers ensure that even if one fails, others remain active to keep the system safe. To perform these functions, the BMS relies on:
