-----

Scientists are developing a new way to turn escaping nighttime heat into "reverse solar"-style energy. Here's how it works.

But a team of scientists in Australia is working on a way to fix that problem by developing a novel type of solar panel that could work at night. It's a sort of solar panel in reverse,...

The startup Reflect Orbital aims to keep solar farms running at night by reflecting sunlight from space and has sparked controversy among astronomers.

A groundbreaking theoretical study from two UC Davis researchers explores the possibility of using thermoradiative "reverse" solar cells to generate power from Earth's residual heat ...

In a world first, a team at the University of New South Wales ...

To fill this gap, scientists are exploring solar-cell-like devices that could generate electricity by exploiting the conditions at night. Thermoradiative diodes are like solar cells in...

The gadget works in a way that it releases an outflow of heat energy aimed towards the sky in the form of infrared radiation. The reverse panels would then harvest this radiation.

Scientists are ironing out the kinks for an "anti-solar power" cell, one that can harvest energy at nighttime, even when the sun isn't shining. Instead of absorbing light from the Sun and ...

For obvious reasons, today's sun-powered solar cells don't work at night. But researchers from the University of California, Davis believe that they may have come up with a solution. And it's...

In a world first, a team at the University of New South Wales (UNSW) has demonstrated measurable power generation from "the inverse of a conventional solar cell."
