-----

About `__func__`: "The identifier `__func__` is implicitly declared by the translator as if, immediately following the opening brace of each function definition, the declaration: `static const char ...`

`(function(){})( );` Lastly, `!` makes the expression return a boolean based on the return value of the function. Usually, an immediately invoked function expression (IIFE) doesn't explicitly return ...

A function of that nature can be called at any time, anywhere. jQuery (a library built on Javascript) has built in functions that generally required the DOM to be fully rendered before being called.

A function (also called a procedure, method, subroutine, or routine or macro) is a portion of code intended to carry out a single, specific task.

12 The `function*` type looks like it acts as a generator function for processes that can be iterated. C# has a feature like this using `&quot;yield return&quot;`; see 1 and see 2 Essentially this returns each ...

509 It's all about variable scoping. Variables declared in the self executing function are, by default, only available to code within the self executing function. This allows code to be written without concern of ...

Calling the function with `()` in a return statement executes the function, and returns whatever value was returned by the function. It is similar to calling `var x = b();`, but instead of assigning the return value of ...

The difference is that `functionOne` is a function expression and so only defined when that line is reached, whereas `functionTwo` is a function declaration and is defined as soon as its ...

A function is outside the namespace of the rest of the program. It is like a separate program that can have the same variable names as used in the calling program, and whatever it does to them does ...
