Are nickel cadmium batteries good for solar power?

Nickel-cadmium batteries are ideal for protecting power quality against voltage sags and providing standby power in harsh conditions . Recently,nickel-cadmium batteries have become popular as storage for solar generation because they can withstand high temperatures.

What is a nickel cadmium battery?

Nickel cadmium (NiCd) batteries are electrochemical devices that consist of a cadmium hydroxide negative anode and a nickel hydroxide positive cathode, capable of operating well at low temperatures, with a higher energy density and lifespan compared to lead acid batteries, but hindered by a memory effect and environmental concerns due to cadmium.

Can nickel cadmium batteries be used at high discharge rates?

Although the battery discharge rate and battery temperature are an important variable for chemical batteries, these parameters have little effect in nickel-cadmium batteries compared to lead-acid batteries. Therefore nickel-cadmium batteries can be used at high discharge rates without losing their nominal capacity.

What is the energy density of a nickel cadmium battery?

The energy density of a typical nickel-cadmium cell is 20 Wh/kg and 40 Wh/L. The nominal voltage of the nickel-cadmium battery cell is 1.2 V. Although the battery discharge rate and battery temperature are an important variable for chemical batteries, these parameters have little effect in nickel-cadmium batteries compared to lead-acid batteries.
